

I currently have DSL over Fibre (IFITL). Over the past several months, I see DSL and Cable providers offering 3MB/sec and 4MB/sec speeds over either DSL over Copper or Cable. My understanding is that there is a "regulation" that CAPS the speed offered on the Fibre connections?

I am unable to get any other type of service, however I'm fortunate I can get DSL on the Fibre connection. Are there any reasons why people on IFITL are still being regulated/capped at 1.5MB/sec?

I've spoken to my provider who has told me that they can't increase the speed, nor can BellSouth (my CO) do anything because of a Federal regulation.

Thank you for any additional feedback or information that you can provide regarding this and if there any plans to change this.

Sincerely,  
George Peters
